Symbolic blenders in the Hölder setting

In this section we prove Theorem C. First, we introduce some notation and preliminary results.

Given a finite word $\bar{\omega} = \omega_{-m} \dots \omega_{-1} \omega_0 \omega_1 \dots \omega_n$, where $m, n \geq 0$ and $\omega_i \in \{1, \dots, k\}$, we define the *bi-lateral cylinder* by

$$\mathcal{C}_{\bar{\omega}} \stackrel{\text{def}}{=} \{\xi \in \Sigma_k : \xi_j = \omega_j, -n \leq j \leq n\}.$$

Given $\zeta \in \Sigma_k$ and a word $\bar{\omega} := \bar{\omega}_{-n} = \omega_{-n} \dots \omega_{-1}$, where $n \geq 1$ and $\omega_i \in \{1, \dots, k\}$, we define the *relative cylinder* by

$$\mathcal{C}_{\bar{\omega}}(\zeta) \stackrel{\text{def}}{=} \{\xi \in W_{loc}^s(\zeta; \tau) : \xi_{-i} = \omega_i, \text{ for } i = 1, \dots, n\}. \quad (9.1)$$

Recall that $\mathcal{S} = \mathcal{S}_{k, \lambda, \beta}^{0, \alpha}$ is the set of symbolic skew product maps in Definition 1.7. Let us observe that in what follows $\nu^\alpha < \lambda < 1$, $\alpha > 0$, and there is no restriction on β . In the next lemma we estimate the distance between the backward orbits of a point x when iterated by different maps ψ_ξ^{-1} .

Lemma 9.1. *Consider $\Psi = \tau \times \psi_\xi \in \mathcal{S}$, a word $\bar{\omega} = \omega_{-n} \dots \omega_0 \dots \omega_n$, and a point $x \in \bar{D}$ such that for every $\zeta \in \mathcal{C}_{\bar{\omega}}$ one has that $\psi_{\tau^{-1}(\zeta)}^{-j}(x) \in \bar{D}$ for every $1 \leq j \leq n$. Then it holds*

$$\|\psi_{\tau^{-1}(\xi)}^{-i}(x) - \psi_{\tau^{-1}(\zeta)}^{-i}(x)\| < C_\Psi \nu^{\alpha(n-i)} \sum_{j=0}^{i-1} (\lambda^{-1} \nu^\alpha)^j,$$

for all $1 \leq i \leq n$ and all $\xi, \zeta \in \mathcal{C}_{\bar{\omega}}$.

Proof. The proof is by induction. For $i = 1$, the Hölder inequality (1.4) and $\xi, \zeta \in \mathcal{C}_{\bar{\omega}}$ imply that

$$\|\psi_{\tau^{-1}(\xi)}^{-1}(x) - \psi_{\tau^{-1}(\zeta)}^{-1}(x)\| \leq C_\Psi d_{\Sigma_k}(\tau^{-1}(\xi), \tau^{-1}(\zeta))^\alpha \leq C_\Psi \nu^{\alpha(n-1)}.$$

We argue inductively. Suppose that the lemma holds for $i - 1$, $i < n$:

$$\|\psi_{\tau^{-1}(\xi)}^{-(i-1)}(x) - \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x)\| < C_\Psi \nu^{\alpha(n-i+1)} \sum_{j=0}^{i-2} (\lambda^{-1} \nu^\alpha)^j, \quad (9.2)$$

for every $\xi, \zeta \in \mathcal{C}_{\bar{\omega}}$. We will see that the estimate also holds for i . By the triangle inequality, one has that

$$\begin{aligned} \|\psi_{\tau^{-1}(\xi)}^{-i}(x) - \psi_{\tau^{-1}(\zeta)}^{-i}(x)\| &\leq \|\psi_{\tau^{-1}(\xi)}^{-i}(x) - \psi_{\tau^{-i}(\xi)}^{-1} \circ \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x)\| + \\ &+ \|\psi_{\tau^{-i}(\xi)}^{-1} \circ \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x) - \psi_{\tau^{-1}(\zeta)}^{-i}(x)\|. \end{aligned}$$

Since the inverse of these functions expand at most $1/\lambda$, we get that the above equation is less than or equal to

$$\frac{1}{\lambda} \|\psi_{\tau^{-1}(\xi)}^{-(i-1)}(x) - \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x)\| + \|\psi_{\tau^{-i}(\xi)}^{-1}(y) - \psi_{\tau^{-i}(\zeta)}^{-1}(y)\|,$$

where $y = \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x) \in \bar{D}$. By induction hypothesis (9.2) we obtain

$$\frac{1}{\lambda} \|\psi_{\tau^{-1}(\xi)}^{-(i-1)}(x) - \psi_{\tau^{-1}(\zeta)}^{-(i-1)}(x)\| \leq C_{\Psi} \lambda^{-1} (\nu^{\alpha})^{n-i+1} \sum_{j=0}^{i-2} (\lambda^{-1} \nu^{\alpha})^j.$$

As $y \in \bar{D}$ applying the Hölder inequality (1.4) and since $\xi, \zeta \in \mathcal{C}_{\bar{\omega}}$ we get

$$\|\psi_{\tau^{-i}(\xi)}^{-1}(y) - \psi_{\tau^{-i}(\zeta)}^{-1}(y)\| \leq C_{\Psi} \nu^{\alpha(n-i)}.$$

Putting together the previous inequalities we get

$$C_{\Psi} \lambda^{-1} (\nu^{\alpha})^{n-i+1} \sum_{j=0}^{i-2} (\lambda^{-1} \nu^{\alpha})^j + C_{\Psi} \nu^{\alpha(n-i)} = C_{\Psi} \nu^{\alpha(n-i)} \sum_{j=0}^{i-1} (\lambda^{-1} \nu^{\alpha})^j,$$

ending the proof of the lemma. \square

9.1

Proof of Theorem C

Consider a one-step map $\Phi = \tau \times (\phi_1, \dots, \phi_k) \in \mathcal{S}$ and an open subset B of D . Recall that we need to prove the following:

B has the covering property for $\mathcal{G}_{\phi_1, \dots, \phi_k} \iff$ there are $\delta > 0$ and a neighborhood \mathcal{V} of Φ in \mathcal{S} such that $\Gamma_{\Psi}^+(\Sigma_k \times B) \cap H^s \neq \emptyset$ for every $\Psi \in \mathcal{V}$ and every δ -horizontal disk H^s in $\Sigma_k \times B$.

\Leftarrow We see that if the covering property is not satisfied then intersection (1.10) is also not satisfied. If B does not satisfy the covering property then there is $x \in \bar{B}$ such that $x \notin \phi_i(B)$ for all $i = 1, \dots, k$. First note that we can assume that $x \in B$. Otherwise, we can take an arbitrarily small perturbation $\Psi = \tau \times (\psi_1, \dots, \psi_k)$ of Φ such that the covering property in B for

$\text{IFS}(\psi_1, \dots, \psi_k)$ is not satisfied for a point in B . The condition $x \notin \phi_i(B)$ for all $i = 1, \dots, k$ implies that $\Phi^{-1}(\xi, x) \notin \Sigma_k \times \overline{B}$ for all $\xi \in \Sigma_k$ and hence

$$(\xi, x) \notin \bigcap_{n \geq 0} \Phi^n(\Sigma_k \times \overline{B}) \stackrel{\text{def}}{=} \Gamma_{\Phi}^+(\Sigma_k \times B) \quad \text{for all } \xi \in \Sigma_k.$$

Therefore $\Gamma_{\Phi}^+(\Sigma_k \times B)$ does not meet the horizontal disk $H^s = W_{loc}^s(\xi; \tau) \times \{x\}$, and thus the intersection property (1.10) is not verified.

\implies We split the proof of the fact that the covering property implies the intersection condition into two steps.

Choice of the neighborhood \mathcal{V} of Φ . First recall that given an open covering \mathcal{C} of a compact set X of a metric space there is a constant $L > 0$, a *Lebesgue number* of \mathcal{C} , such that every subset of X with diameter less than L is contained in some member of \mathcal{C} .

Let $2L > 0$ be a Lebesgue number of the covering $\{\phi_1(B), \dots, \phi_k(B)\}$ of the set \overline{B} . Note that there are C^0 -neighborhoods \mathcal{U}_i of ϕ_i such that the family

$$B_i = \text{int} \left(\bigcap_{\psi \in \mathcal{U}_i} \psi(B) \right), \quad i = 1, \dots, k, \quad (9.3)$$

is an open covering of \overline{B} . By shrinking the size of the sets \mathcal{U}_i we can assume that L is a Lebesgue number of this covering. We can also assume that any $\psi \in \mathcal{U}_i$ is a C^0 - (λ, β) -Lipschitz map on \overline{D} for all $i = 1, \dots, k$.

We take a neighborhood \mathcal{V} of Φ in \mathcal{S} such that if $\Psi = \tau \times \psi_{\xi} \in \mathcal{V}$ then $\psi_{\xi} \in \mathcal{U}_{\xi_0} = \mathcal{U}_i$. In that case, by (9.3), we get that

$$\psi_{\tau^{-1}(\xi)}^{-1}(\overline{B}_{\xi_0}) \subset B \quad \text{for all } \xi \in \Sigma_k. \quad (9.4)$$

Since Φ is a one-step map then $\phi_{\xi} = \phi_{\zeta}$ if $\xi_0 = \zeta_0$, hence we can take the Hölder constant $C_{\Phi} = 0$. The definition of the distance in (1.6) implies that C_{Ψ} is close to $C_{\Phi} = 0$. Since, by hypothesis, $\nu^{\alpha} < \lambda$, by shrinking the neighborhood \mathcal{V} we can assume that for every $\Psi = \tau \times \psi_{\xi} \in \mathcal{V}$ it holds

$$C_{\Psi} \sum_{i=0}^{\infty} (\lambda^{-1} \nu^{\alpha})^i < L/2. \quad (9.5)$$

This completes the choice of the neighborhood \mathcal{V} of Φ .

Existence of a point in $\Gamma_{\Psi}^+(\Sigma_k \times B) \cap H^s$. The main step is the following proposition.

Proposition 9.2. *Let \mathcal{V} the neighborhood of Φ above. Consider small $\delta > 0$ and a δ -horizontal disk H^s associated to $W_{loc}^s(\zeta; \tau) \times \{z\}$ for some $(\zeta, z) \in \Sigma_k \times B$. Then there are a sequence of nested compact subsets $\{V_n\}$ of B contained in $\mathcal{P}(H^s)$ and a sequence $\xi \in W_{loc}^s(\zeta; \tau)$ such that for all $\Psi = \tau \times \psi_{\xi} \in \mathcal{V}$ it*

holds

$$\psi_{\tau^{-1}(\xi)}^{-n}(V_n) \subset B \quad \text{and} \quad \text{diam}(\psi_{\tau^{-1}(\xi)}^{-n}(V_n)) \rightarrow 0.$$

Let us see how the implication (\implies) follows from this proposition. Let $\{x\} = \bigcap_n V_n$. By the first part of the proposition $\psi_{\tau^{-1}(\xi)}^{-n}(x) \in B$ for all $n \in \mathbb{N}$ and thus $\Psi^{-n}(\xi, x) \in \Sigma_k \times B$ for all $n \in \mathbb{N}$ and hence $(\xi, x) \in \Gamma_{\Psi}^+(\Sigma_k \times B)$. Note that since $\xi \in W_{loc}^s(\zeta; \tau)$ and $x \in \mathcal{P}(H^s)$ then we also have $(\xi, x) \in H^s$. Thus $\Gamma_{\Psi}^+(\Sigma_k \times B) \cap H^s \neq \emptyset$.

To complete the proof of Theorem C it remains to prove the proposition.

Proof of Proposition 9.2. Consider $\delta > 0$ such that $\lambda^{-1}\delta < L/2$ for the δ -horizontal disk H^s associated to $W_{loc}^s(\zeta; \tau) \times \{z\}$ and the (α, C) -Hölder graph map h (see Definition 1.9). The construction of the nested sequence of sets $\{V_n\}$ and the point $\xi \in W_{loc}^s(\zeta; \tau)$ is done inductively. Let

$$V := \mathcal{P}(H^s) \subset B.$$

Note that $\text{diam}(V) \leq 2\delta < L$. Thus, by the definition of the Lebesgue number, $V \subset B_{i_1}$ for some $i_1 \in \{1, \dots, k\}$. Recall the definition of the relative cylinder in (9.1) associated to $\zeta \in \Sigma_k$ and the word $\bar{\omega}_{-1} = i_1$ and consider the set

$$V_1 := \mathcal{P}(H^s \cap (\mathcal{C}_{\bar{\omega}_{-1}}(\zeta) \times V)).$$

By construction, $V_1 \subset V \subset B_{i_1}$. Thus, by (9.4), for every $\Psi = \tau \times \psi_{\xi} \in \mathcal{V}$ one has that

$$\psi_{\tau^{-1}(\xi)}^{-1}(V_1) \subset B. \quad (9.6)$$

Claim 9.3. $\text{diam}(V_1) \leq \delta_1 \stackrel{\text{def}}{=} C\nu^{2\alpha}$.

Proof. Given x and y in V_1 there are ξ and η in $\mathcal{C}_{\bar{\omega}_{-1}}(\zeta)$ such that $x = h(\xi)$ and $y = h(\eta)$. Since h is (α, C) -Hölder continuous we have

$$\|x - y\| = \|h(\xi) - h(\eta)\| \leq Cd_{\Sigma_k}(\xi, \eta)^\alpha \leq C\nu^{2\alpha} = \delta_1,$$

proving the claim. \square

By Claim 9.3 and since for every $\Psi = \tau \times \psi_{\xi} \in \mathcal{V}$ the maps ψ_{ξ} are (λ, β) -Lipschitz we have that

$$\text{diam}(\psi_{\tau^{-1}(\xi)}^{-1}(V_1)) \leq \lambda^{-1}\delta_1 \quad \text{for all } \xi \in \mathcal{C}_{\bar{\omega}_{-1}}(\zeta).$$

Recalling that $C\nu^\alpha < \delta$ (see Definition 1.9) we get

$$\lambda^{-1}\delta_1 = \lambda^{-1}C\nu^{2\alpha} \leq \lambda^{-1}C\nu^\alpha < \lambda^{-1}\delta \leq L/2.$$

Therefore

$$\text{diam}(\psi_{\tau^{-1}(\xi)}^{-1}(V_1)) \leq \lambda^{-1}\delta_1 \leq L/2.$$

Arguing inductively, suppose that we have constructed words $\bar{\omega}_{-n} := \omega_{-n} \dots \omega_{-1}$ (the word $\bar{\omega}_{-i}$ is obtained adding the letter ω_{-i} to the word $\bar{\omega}_{-i+1}$) and closed sets $V_n \subset V_{n-1} \subset \dots \subset V_1$ with

$$\text{diam}(V_n) \leq C\nu^{(n+1)\alpha} \stackrel{\text{def}}{=} \delta_n \quad (9.7)$$

and such that for every $\Psi = \tau \times \psi_\xi \in \mathcal{V}$ one has that for all $\xi \in \mathcal{C}_{\bar{\omega}_{-n}}(\zeta)$ it holds

$$\psi_{\tau^{-1}(\xi)}^{-n}(V_n) \subset B \quad \text{and} \quad \text{diam}(\psi_{\tau^{-1}(\xi)}^{-n}(V_n)) \leq \lambda^{-n}\delta_n. \quad (9.8)$$

We now construct the word $\bar{\omega}_{-(n+1)}$ and the closed set $V_{n+1} \subset V_n$ satisfying analogous inclusions and inequalities. By (9.8) we have that

$$A_n \stackrel{\text{def}}{=} \bigcup_{\xi \in \mathcal{C}_{\bar{\omega}_{-n}}(\zeta)} \psi_{\tau^{-1}(\xi)}^{-n}(V_n) \subset B.$$

Claim 9.4. $\text{diam}(A_n) < L$.

Proof. Given \bar{x} and \bar{y} in A_n there are $x, y \in V_n$ and $\xi, \eta \in \mathcal{C}_{\bar{\omega}_{-n}}(\zeta)$ such that $\bar{x} = \psi_{\tau^{-1}(\xi)}^{-n}(x)$ and $\bar{y} = \psi_{\tau^{-1}(\eta)}^{-n}(y)$. Then

$$\begin{aligned} \|\bar{x} - \bar{y}\| &= \|\psi_{\tau^{-1}(\xi)}^{-n}(x) - \psi_{\tau^{-1}(\eta)}^{-n}(y)\| \\ &\leq \|\psi_{\tau^{-1}(\xi)}^{-n}(x) - \psi_{\tau^{-1}(\eta)}^{-n}(x)\| + \|\psi_{\tau^{-1}(\eta)}^{-n}(x) - \psi_{\tau^{-1}(\eta)}^{-n}(y)\| \\ &\leq C_\Psi \sum_{j=0}^{n-1} (\lambda^{-1}\nu^\alpha)^j + \lambda^{-n}\delta_n \end{aligned} \quad (9.9)$$

$$\leq L/2 + \lambda^{-n}\delta_n, \quad (9.10)$$

where (9.9) follows from Lemma 9.1 and induction hypothesis (9.8), and the last inequality (9.10) follows from (9.5). Note also that

$$\lambda^{-n}\delta_n = \lambda^{-n}C(\nu^\alpha)^{n+1} \leq C(\lambda^{-1}\nu^\alpha)^n \leq C\lambda^{-1}\nu^\alpha < \lambda^{-1}\delta < L/2.$$

Therefore for every pair of points $\bar{x}, \bar{y} \in A_n$ we have $\|\bar{x} - \bar{y}\| < L$ and thus $\text{diam}(A_n) < L$, proving the claim. \square

As L is a Lebesgue number of the covering $\{B_i\}_{i=1}^k$, the claim implies that there is $i_{n+1} \in \{1, \dots, k\}$ such that $A_n \subset B_{i_{n+1}}$. We let

$$\bar{\omega}_{-(n+1)} = i_{n+1}\omega_{-n} \dots \omega_{-1} \quad \text{and} \quad V_{n+1} = \mathcal{P}(H^s \cap (\mathcal{C}_{\bar{\omega}_{-(n+1)}}(\zeta) \times V_n)).$$

Note that by construction $V_{n+1} \subset V_n$.

Claim 9.5. $\text{diam}(V_{n+1}) \leq C \nu^{(n+2)\alpha} \stackrel{\text{def}}{=} \delta_{n+1}$.

Proof. Just note that given $x, y \in V_{n+1}$ there are $\xi, \eta \in \mathcal{C}_{\bar{\omega}_{-(n+1)}}(\zeta)$ such that $x = h(\xi)$ and $y = h(\eta)$. From the (α, C) -Hölder continuity of h and since $\xi, \eta \in \mathcal{C}_{\bar{\omega}_{-(n+1)}}(\zeta)$ we get

$$\|x - y\| \leq C d_{\Sigma_k}(\xi, \eta)^\alpha \leq C \nu^{(n+2)\alpha}.$$

Thus $\text{diam}(V_n) \leq C \nu^{(n+2)\alpha} = \delta_{n+1}$. \square

Using $V_{n+1} \subset V_n$, $\text{diam}(V_n) \leq \delta_{n+1}$, and Equations (9.4) and (9.8) we get that for all $\Psi = \tau \times \psi_\xi \in \mathcal{V}$ it holds

$$\psi_{\tau^{-1}(\xi)}^{-(n+1)}(V_{n+1}) \subset B \quad \text{and} \quad \text{diam}\left(\psi_{\tau^{-1}(\xi)}^{-(n+1)}(V_{n+1})\right) \leq \lambda^{-(n+1)}\delta_{n+1}, \quad (9.11)$$

for every $\xi \in \mathcal{C}_{\bar{\omega}_{-(n+1)}}(\zeta)$. Therefore (9.8) holds for $n + 1$ -step and we can continue arguing inductively. This completes the construction of the sequence of nested sets V_n in the proposition. Observe that the sequence ξ whose positive part is ζ and whose negative part satisfies $\xi_{-n} = \omega_{-n}$ belongs to $\mathcal{C}_{\bar{\omega}_{-(n+1)}}(\zeta) \subset W_{loc}^s(\zeta; \tau)$. This completes the proof of the proposition. \square

The proof of Theorem C is now complete. \square
