To my grandmother Lenira de Barros Mendes,
in memoriam.

Acknowledgments

I would like to thank my advisor, Professor Márcio da Silveira Carvalho, for all the support and advices during the development of this work.

My co-advisor, Professor Marcos de Oliveira Lage Ferreira, for the help specially in the very beginning and end of the work. I would like to thank Professor Hélio Lopes for sharing his knowledge and for the discussions about the problems involved in this work.

I would like to thank CNPQ for financial support.

My acknowledgments to Dr. Shawn Dodds and Eric Vandre for the friendship and discussions on this work. I would like to thank Americo Barbosa da Cunha Junior for the friendship since undergraduate course and for a lot of help with L^AT_EX, in which this document is being written.

I shall thank Professors Lorraine Francis and Satish Kumar for the kind support during IPRIME 2011 at the University of Minnesota. There, I presented part of this work. I shall thank my advisor, Professor Márcio, for all the support, while in Minneapolis, and for giving me the opportunity to live this experience.

For the remarkable classes during M.Sc, I wish to thank Professors Angela Ourivio Nieckele, Luís Fernando Alzuguir Azevedo, Márcio da Silveira Carvalho and Waldemar Celes Filho.

Dr. Anderson Pereira and Dr. Ivan Fábio Menezes for the relentless discussions about solvers and also for the speedups in the 2D Matlab code.

Frederico Carvalho Gomes for helping me to install and use UMFPACK. Adré Derraik for the help with OpenGL libraries in 64 bits. Cesar Palomo and Andrei Monteiro for the help with 64 bits project definitions and libraries.

Dr. Luiz Cristovão Gomes Coelho –Lula– for the support and friendship during the entire M.Sc. program. His support was important to enable me to develop the bulk of this research at Tecgraf/PUC-Rio.

To my parents I want to say: Obrigado!

Abstract

Kassar, Bruno de Barros Mendes; Carvalho, Márcio da Silveira (Advisor); Ferreira, Marcos de Oliveira Lage (Co-Advisor). **Three dimensional flow with suspended spherical particles**. Rio de Janeiro, 2012. 62p. Dissertação de Mestrado — Departamento de Engenharia Mecânica, Pontifícia Universidade Católica do Rio de Janeiro.

This work presents a novel implicit and fully coupled formulation for the problem of 3D flows with suspended rigid bodies. This is the main contribution of the work. The formulation was implemented in C++ and tested for the sedimentation problem of one spherical particle. The results indicate plausible physical behavior in spite of being limited by mesh accuracy. The software solves numerically the Navier-Stokes Equations coupled with Rigid Body Dynamics' Equations using the Finite Elements Method. The coupling between fluid and solid domains is done by means of the Fictitious Domain Technique, which avoids mesh generation for every time step. The 3D flow of non particulate flow is also studied in this work and is the basis for the particulate flow formulation.

Keywords

Fluid Mechanics; Finite Elements Method; Navier-Stokes; Fictitious Domain Method.

Resumo

Kassar, Bruno de Barros Mendes; Carvalho, Márcio da Silveira; Ferreira, Marcos de Oliveira Lage. **Escoamento Tridimensional com Partículas Esféricas Suspensas**. Rio de Janeiro, 2012. 62p. Dissertação de Mestrado — Departamento de Engenharia Mecânica, Pontifícia Universidade Católica do Rio de Janeiro.

Este trabalho apresenta uma nova formulação implícita e totalmente acoplada para o problema de escoamentos tridimensionais com corpos rígidos suspensos. Esta é a principal contribuição deste trabalho. A formulação foi implementada em C++ e testada para o problema de sedimentação de uma partícula esférica. Os resultados indicam comportamento físico plausível apesar de serem limitados por inacurácia de malha. O programa resolve numericamente as Equações de Navier-Stokes acopladas com as Equações da Dinâmica de Corpo Rígido usando o Método de Elementos Finitos. O acoplamento entre os domínios fluido e sólido é feito pela Técnica do Domínio Fictício, que evita a geração de malha a cada passo de tempo. O escoamento tridimensional sem partículas também é estudado neste trabalho e é a base para a formulação do escoamento com partículas.

Palavras-chave

Mecânica dos Fluidos; Método dos Elementos Finitos; Navier-Stokes; Método do Domínio Fictício.

List of Figures

1.1	The 2D circular particle.	16
1.2	The 3D axis.	16
1.3	Sketch of 2D and 3D particles.	17
2.1	The hexahedral element, with 27 nodes. The nodes are indexed from 0 to 26.	20
2.2	The six domain walls: front, back, left, right, bottom and top.	21
2.3	Lid-driven cavity. The cavity is a closed box with no-slip condition on the walls. The upper wall is the lid, which moves on the horizontal.	21
2.4	2D velocity field generated with the 3D solver with $Re=10$ and a mesh of $25 \times 25 \times 1$ elements.	22
2.5	u and v velocities along the centerlines. $Re=10$ and mesh= $25 \times 25 \times 1$ elements. Circles correspond to the 3D solution and the continuous lines correspond to the 2D solution.	22
2.6	$Re=10$ and $t=0.1s$.	23
2.7	$Re=10$ and $t=0.2s$.	23
2.8	$Re=10$ and $t=0.5s$.	24
2.9	3D velocity field of the lid-driven cavity problem.	24
3.1	The entire domain Ω , the fluid domain Ω_f and three particles Ω_{P_k} .	25
3.2	Mesh wrapping around the particle.	26
3.3	Fixed mesh at every instant of time.	27
3.4	The sedimenting particle and the mesh used to simulate the flow.	34
3.5	Velocity and Lagrange Multipliers fields on the plane $z = 0$ of the 3D flow with one particle. Notice the rigid body motion inside the particle and that λ is zero in the fluid domain.	35
3.6	Velocity and Lagrange Multipliers fields of the 3D flow with one particle. Notice the rigid body motion inside the particle on the velocity field and that λ is zero in the fluid domain.	36
3.7	Pressure field obtained on the instant $0.1s$.	37
3.8	Position variation components (x, y, z) of the sedimenting particle against time.	37
3.9	Linear velocity components (x, y, z) of the sedimenting particle against time.	38
3.10	Angular velocity components (x, y, z) of the sedimenting particle against time.	38
3.11	Initial configuration of the lid-driven cavity flow with a particle.	38
3.12	Position variation components (x, y, z) of the particle against time in the lid-driven cavity flow.	39
3.13	Linear velocity components (x, y, z) of the particle against time in the lid-driven cavity flow.	39
3.14	Angular velocity components (x, y, z) of the particle against time in the lid-driven cavity flow.	39

4.1	Global Jacobian matrix for a mesh 5x5x5 with one particle. Notice the bottom lines and the right hand side columns.	42
4.2	Elapsed time in the solver with partitioned Jacobian matrix and not partitioned	44
4.3	The steps of mesh generation. From the volume, we generate surfaces, then lines and points.	46

List of Tables

1.1	Units used for each quantity	17
2.1	The elemental degrees of freedom and its indexation.	20
3.1	The elemental degrees of freedom and its indexation for particulate flow.	33

Nomenclature

σ	incompressible Newtonian fluid stress tensor
$\mathbf{I}$	identity matrix
μ	fluid's dynamic viscosity
ρ_f	fluid's specific mass
ρ_P	specific mass of the particle
$\star$	any direction x , y or z .
$\vec{\lambda}$	the Lagrange Multipliers vector with components $[\lambda_x, \lambda_y, \lambda_z]^T$
$\vec{\omega}_{P_k}$	Angular velocity $[\omega_{xP_k}, \omega_{yP_k}, \omega_{zP_k}]^T$ of the particle k
$\vec{g}$	gravity acceleration vector $[g_x, g_y, g_z]^T$
$\vec{n}_{P_k}$	normal vector on the particle surface pointing outward the particle
$\vec{V}_{P_k}$	Linear velocity $[u_{P_k}, v_{P_k}, w_{P_k}]^T$ of the particle k
$\vec{V}$	velocity vector $[u, v, w]^T$
$\vec{x}$	the position vector with components $[x, y, z]^T$
L	the the characteristic length of the cavity
N_{DOF}	the total number of degrees of freedom.
N_{elems}	number of elements.
N_{elems}^x	number of elements in x direction.
N_{elems}^y	number of elements in y direction.
N_{elems}^z	number of elements in z direction.
N_{nodes}	number of nodes.
N_{nodes}^x	number of nodes in x direction.
N_{nodes}^y	number of nodes in y direction.
N_{nodes}^z	number of nodes in z direction.
N_{parts}	number of particles.
p	pressure
R_P	radius of the particle
u_l	the lid's velocity on the lid driven cavity problem

Being entirely honest with oneself is a good exercise.

Sigmund Freud, *Letter to Wilhelm Fliess*.
